The compounds of this invention can be prepared by various processes, for example, by the following reaction schemes.

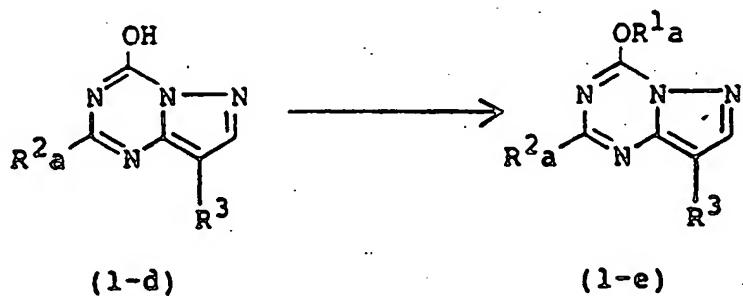

Reaction Scheme-1

wherein R^3 is as defined above.

The compounds (1-a) of this invention can be prepared by reacting a compound (2) with an alkyl orthoformate (e.g. methyl orthoformate, ethyl orthoformate, etc.). The reaction can be carried out in a solvent which does not affect on the reaction, but since the alkyl orthoformate can also act as a solvent, use of a specific solvent is not necessarily essential. The reaction is usually carried out by using 15 moles of the alkyl orthoformate per 1 mole of the compound (2) at a temperature of 80 to 120°C for 2 to 15 hours.

Reaction Scheme-2

wherein R^3 is as defined above, R^1a is a lower alkanoyl, and R^2a is hydrogen atom.

The above process comprises acylating the 4-hydroxy group of the compound (1-d) to obtain the compound (1-e). The reaction can be carried out by a conventional acylating reaction, for example, an acid halide method and an acid anhydride method, a mixed acid anhydride method, an N,N'-dicyclohexylcarbodiimide method (DCC method), particularly preferably by an acid anhydride method or an acid halide method.

The acid anhydride method can be carried out by reacting the compound (1-d) with an acid anhydride in a suitable solvent. The acid anhydride includes an anhydride of an acid corresponding to the acyl group to be introduced into the 4-hydroxy group of the compound (1-d). Suitable examples of the acid anhydride are acetic anhydride, propionic anhydride, butyric anhydride. These acid anhydrides are used in an amount of at least 1 mole, preferably about 1 to 3 moles, per 1 mole of the compound (1-d). The solvent includes various inert solvents, such as pyridine, halogenated hydrocarbons (e.g. chloroform, dichloromethane), ethers (dioxane, tetrahydrofuran (THF)), aromatic hydrocarbons (e.g. benzene, toluene), N,N-dimethylformamide (DMF), dimethylsulfoxide (DMSO) and acetonitrile. The reaction is usually carried out at a temperature from -30 °C to 100 °C, preferably from room temperature to 80 °C, for 20 minutes to 20 hours. Besides, the reaction proceeds preferably in the presence of a basic compound. The basic compound includes, for example, organic basic compounds such as tertiary amines (e.g. pyridine, triethylamine, N,N-dimethylaniline), and inorganic basic compounds such as sodium hydrogen carbonate, potassium carbonate and sodium acetate.

The acid halide method is carried out by reacting the compound (1-d) with an acid halide corresponding to the acyl group to be introduced (e.g acid chloride, acid bromide) in the presence of a basic compound in a suitable solvent. The solvent and basic compound include the same solvents and basic compounds as mentioned as to the above acid anhydride method. The reaction is usually carried out at a temperature from -30 °C to 80 °C, preferably from 0 °C to room temperature, for 5 minutes to 10 hours.

The compounds of this invention can be prepared by the above-mentioned processes of Reaction Schemes-1 to -4, and further, the compounds having a substituent(s) on the phenyl ring or the unsaturated heterocyclic ring having nitrogen or sulfur atom at 8-position of the compounds can also be prepared by introduction of the substituent(s) or exchange of the substituent(s) as mentioned below. In the following explanation, only the substituent(s) to be introduced or exchanged is mentioned, but the compounds may have any various substituents on the phenyl ring or the unsaturated heterocyclic ring as defined in the claims.

Exchange Reaction-1

55 In case of the compound having a lower alkyl group on the phenyl ring, the lower alkyl group can be converted into a carboxy group by oxidizing it with an oxidizing agent such as potassium permanganate and chromic acid. The exchange reaction can be carried out in a solvent (e.g. water) under ice cooling for 5 to

24 hours. The oxidizing agent is preferably used in an amount of 1 to 2 moles to 1 mole of the compound having a lower alkyl group.

Exchange Reaction-2

5

In case of the compound having a carboxy group on the phenyl ring, the carboxy group can be converted into a corresponding ester group by a conventional esterification reaction. The exchange reaction can be carried out by reacting the compound having a carboxy group with a lower alcohol (e.g. methanol, ethanol) in the presence of a catalyst (e.g. sulfuric acid, hydrogen chloride) at a boiling point of the solvent for 24 hours. The lower alcohol is preferably used in an amount of 100 to 500 moles to 1 mole of the compound having a carboxy group.

Exchange Reaction-3

15 In case of the compound having a phenyl group substituted by a lower alkyl group containing methylene group, the methylene group can be converted into a carbonyl group by a conventional oxidization reaction. The exchange reaction can advantageously be carried out by using an oxidizing agent such as selenium dioxide, chromic acid, and the like in a solvent (e.g. acetic acid, a mixture of acetic acid and water) at a room temperature for 10 to 18 hours. The oxidizing agent is used in an amount of 5 moles to 1 mole of the compound containing methylene group.

Exchange Reaction-4

25 In case of the compound having a lower alkylenedioxy group (i.e. the carbonyl group being protected with a lower alkylene) on the phenyl ring, the lower alkylenedioxy group can be converted into a carboxy group by subjecting it to a conventional removal of a protecting group. The exchange reaction can advantageously be carried out by reacting one mole of the compound having a lower alkylenedioxy group with 10 moles of a mineral acid (e.g. hydrochloric acid, sulfuric acid) in a solvent at a temperature of 40 to 30 60 °C for 1 to 3 hours. The solvent used in the above exchange reaction includes a mixture of a lower alcohol (e.g. methanol, ethanol) and water.

Exchange Reaction-5

35 In case of the compound having a phenyl ring or an unsaturated heterocyclic group having nitrogen or sulfur atom as the hetero atom (hereinafter, referred to merely as unsaturated heterocyclic group) of this invention, nitro group can be introduced onto the phenyl ring or the unsaturated heterocyclic group by a conventional nitration reaction. The reaction can advantageously be carried out under the conditions as used in a conventional nitration reaction, for example, by treating with conc. nitric acid, fuming sulfuric acid, or a mixture of conc. nitric acid - conc. sulfuric acid in a solvent (e.g. acetic acid) at a temperature from room temperature to 60 °C for one hour. In case of introduction of nitro group onto the above unsaturated heterocyclic group, the reaction is preferably carried out at room temperature.

Exchange Reaction-6

45 In case of the compound having a nitro group on the phenyl ring, the nitro group can be converted into an amino group by a conventional catalytic reduction. The exchange reaction can advantageously be carried out, for example, by subjecting the compound to a hydrogenation with palladiumcarbon in a mixed solvent of methanol-water at room temperature for 14 hours.

In case of the compound having an alkoxy group having optionally a phenyl substituent on the phenyl ring, the alkoxy group can be converted into a hydroxy group by reacting it with an aluminum halide. The exchange reaction can be carried out by using an aluminum halide (e.g. aluminum chloride, aluminum bromide) of 6 moles to 1 mole of the compound having an alkoxy group in a solvent such as an aromatic compound (e.g. nitrobenzene, chlorobenzene). The reaction is advantageously carried out at a temperature of from room temperature to 60 °C for 1 to 5 hours.

When the alkoxy group is benzyloxy group, the reaction is preferably carried out at room temperature for

one hour.

Exchange Reaction-8

5 In case of the compound having hydroxy group on the phenyl ring, the hydroxy group can be converted into an acyloxy group by reacting it with a lower fatty acid anhydride or lower fatty acid halide in such a manner as the acylation reaction in the above Reaction Scheme-4. The exchange reaction can be carried out by reacting one mole of the compound having hydroxy group on the phenyl ring with at least one mole, preferably 1.1 to 1.5 mole, of the lower fatty acid anhydride or lower fatty acid halide. The reaction is 10 advantageously carried out at room temperature for 45 minutes.

Exchange Reaction-9

15 In case of the compound having a lower alkylthio group on the phenyl ring, the lower alkylthio group can be converted into a lower alkylsulfinyl group by oxidizing it with an oxidizing agent such as periodate and hydrogen peroxide. The exchange reaction can be carried out by using a periodate (e.g. sodium periodate, potassium periodate, etc.) of 2 moles to 1 mole of the compound having a lower alkylthio group in a solvent such as a mixture of a lower alcohol (e.g. methanol, ethanol) with water (40 : 1). The reaction is 20 advantageously carried out at room temperature for 40 hours. Besides, the reaction can also be carried out under the same conditions as in the above Exchange Reaction-3 except that the above-mentioned solvent is used.

Moreover, in case of the compound having a phenylthio group on the phenyl ring, the phenylthio group can be converted into a phenylsulfinyl group in the same manner as described above.

25 Exchange Reaction-10

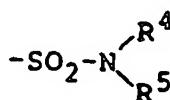

In case of the compound having a lower alkylthio group or lower alkylsulfinyl group on the phenyl ring, the lower alkylthio or alkylsulfinyl group can be converted into a lower alkylsulfonyl group by oxidizing it with hydrogen peroxide. The exchange reaction can be carried out by reacting one mole of the compound 30 having a lower alkylthio or lower alkylsulfinyl group on the phenyl ring with 30 moles of hydrogen peroxide in a solvent (e.g. acetic acid). The reaction is advantageously carried out at a temperature of 70 to 80 °C for about one hour.

Exchange Reaction-11

The reaction is advantageously carried out at a temperature from 0 °C to room temperature for 2 hours.

Exchange Reaction-12

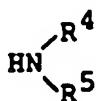

45 Introduction of the group:

(wherein R⁴ and R⁵ are as defined above) onto the phenyl ring can be done by introducing sulfonic group 55 onto the phenyl ring by reacting a compound having a phenyl group with a halogenosulfonic acid and subjecting the resultant to a conventional amido bond forming reaction. The halogenosulfonic acid used in the above reaction includes chlorosulfonic acid and bromosulfonic acid. The above reaction can advantageously be carried out by reacting one mole of a compound having a phenyl group with 20 to 25 moles of a

halogenosulfonic acid at 80 °C for 1 to 3 hours, by which chlorosulfonyl group is introduced onto the phenyl ring, and then reacting the resultant with an amine of the formula:

5

10 (wherein R⁴ and R⁵ are as defined above) without using a solvent or in the presence of an organic basic compound (e.g. pyridine, triethylamine) at a temperature of 50 to 100 °C for 2 to 15 hours

Exchange Reaction-13

15 Introduction of a halogen atom onto the phenyl ring can be done by a conventional halogenation reaction. The halogenation reaction can be done by reacting one mole of a compound having a phenyl group with 5 moles of a halogen molecule in a solvent such as an aromatic compound (e.g. nitrobenzene, chlorobenzene, bromobenzene). The reaction is advantageously carried out in the presence or absence of a catalyst (e.g. aluminum chloride) at a temperature of 50 to 60°C for 4 hours.

20 Besides, when a compound having a phenylthio group on the phenyl ring is subjected to the above-mentioned halogenation reaction at room temperature for 12 hours, the compound having a phenylthio group on the phenyl ring can be converted into a compound having a halogen-substituted phenylthio group on the phenyl ring.

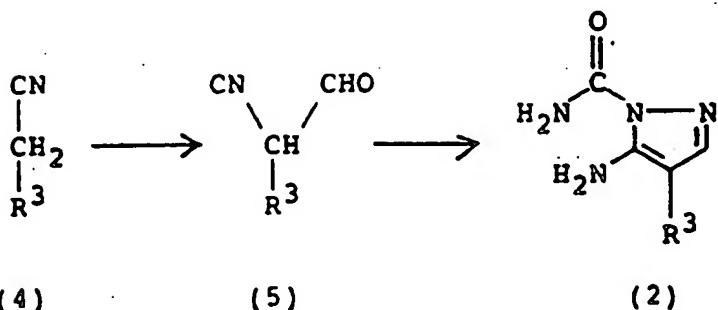

Moreover, when a compound having an unsaturated heterocyclic group is subjected to the above-mentioned halogenation reaction at room temperature for one hour, a halogen atom can be introduced onto the unsaturated heterocyclic group of the compound having an unsaturated heterocyclic group.

Reaction Scheme- 8

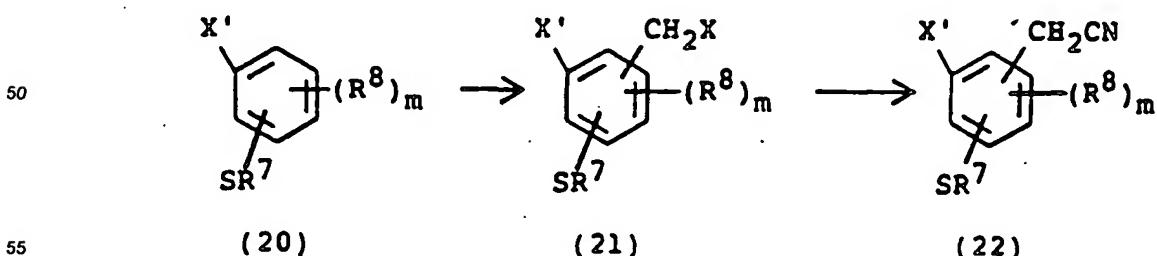

wherein R⁷, R⁸ and m are as defined above, X' is hydrogen atom or a halogen atom, and X'' is a halogen atom.

35 The above process comprises replacing the halogen atom (X'') in the compound (18) with a group: -SR⁷ to obtain the compound (20). The reaction is carried out by preparing a Grignard reagent by adding an excess amount of magnesium to the compound (18) in an ether (e.g. diethyl ether, tetrahydrofuran) and reacting the produced Grignard reagent with a disulfide compound (19). The reaction for forming Grignard reagent is preferably carried out in the presence of a catalytic amount of an iodine compound (e.g. iodine, 40 methyl iodide). The reaction of the Grignard reagent with the compound (19) is usually carried out at a temperature from room temperature to a boiling point of the solvent for 1 to 10 hours, wherein the compound (19) is used in an amount of at least 1 mole, preferably 1 to 1.2 mole, per 1 mole of the compound (18).

The above conversion of the compound (20) to the compound (21) can be carried out by subjecting the compound (20) to a halogenomethylation by a conventional halogenomethylation reaction. The reaction is carried out by reacting the compound (20) with a halogenomethylating agent in an inert solvent in the presence of a catalyst. The inert solvent includes halogenated hydrocarbons (e.g. methylene chloride, 5 chloroform, dichloroethane, carbon tetrachloride) and carbon disulfide. The catalyst includes, for example, Lewis acids (e.g. aluminum chloride, iron chloride, zinc chloride, antimony pentachloride, tin tetrachloride, boron trifluoride), protonic acids (e.g. hydrogen fluoride, conc. sulfuric acid). The halogenomethylating agent includes, for example, chloromethyl methyl ether, bromomethyl methyl ether, dichloromethyl ether and dibromomethyl ether. The catalyst is used in an amount of 1 to 3 moles, preferably 2 moles, per 1 mole of 10 the compound (20). The halogenomethylating agent is used in an amount of 1 to 3 moles, preferably 2 moles, per 1 mole of the compound (20). The above reaction is usually carried out at room temperature or an elevated temperature for 1 to 5 hours.

In the above reaction, the position of substitution of the halogenomethyl group varies depending on the kinds and numbers of the substituents of the compound (21), the electronic density and the steric hindrance of the replaceable carbon atom(s) on the benzene ring, and when the products are obtained in a mixture of two or more different compounds, they can be isolated and purified by a conventional purification method, such as distillation and column chromatography.

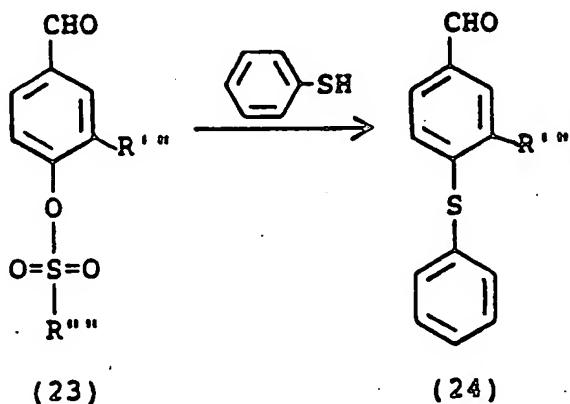

The reaction of converting the compound (21) into the compound (22) is carried out in the same manner as in the conversion of the compound (16) into the compound (17) in the above Reaction Scheme-11.

In case of the compound (4) wherein R³ is a phenyl having one to three groups of -S-R' (wherein R' is a lower alkyl, a halogen-substituted lower alkyl, or a phenyl which may have one to three substituents selected from a halogen atom, a lower alkyl and a lower alkoxy on the phenyl ring), the compound can be converted into a compound (4) wherein R³ is a phenyl having one to three groups of -SO-R' (wherein R' is as defined above) by oxidizing it in the same manner as in the above Conversion Reaction-9. In the reaction, when hydrogen peroxide is used as the oxidizing agent, it is used in an amount of 1 to 3 moles, preferably 1.5 to 2.5 moles, per 1 mole of the compound (4), and the reaction is carried out at room temperature for 4 to 24 hours, preferably 10 hours.

30 The compound (4) wherein R³ is a phenyl having one to three groups of -SO-R' (wherein R' is as defined above) obtained above can be converted into a compound (5) wherein R³ is a phenyl having one to three groups of -SO-R' (wherein R' is as defined above) by the same method as used in the conversion of the compound (4) into the compound (5) in the above Reaction Scheme-3. Moreover, the compound can be converted into the corresponding compound (2) by the same methods as in Reaction Scheme-3.

After taking off the ice bath, the mixture is reacted for 12 hours. The reaction mixture is neutralized with 5N sodium hydroxide solution. The mixture is stirred for 20 minutes, and the resulting precipitate is separated by filtration, washed with water and dried to give 3-amino-2-carbamoyl-4-phenylpyrazole (16.82 g). This product is used in the subsequent procedure without purification.

Reference Example 14

15 To a suspension of sodium methoxide (10.8 g) in benzene (300 ml) is added dropwise with stirring a mixture of ethyl formate (16.28 g) and phenylacetonitrile (23.4 g) under ice cooling. After 30 minutes, the ice bath is taken off. After reacting for 3 hours, ice water is added to the reaction mixture, and the aqueous layer is separated. The organic layer is washed with 0.5 N sodium hydroxide solution (100 ml x 3), and the aqueous layer and the washings are combined and adjusted to pH 3-4 with conc. hydrochloric acid. The 20 mixture is stirred under ice cooling for 20 minutes, and the resulting precipitate is separated by filtration and washed with water to give α -formylphenylacetonitrile (21.13 g). The product is used in the subsequent procedure without further purification.

25 A mixture of the α -formylphenylacetonitrile (18.85 g) obtained above, hydrazine hydrate (8.46 g), acetic acid (16.9 ml) and benzene (200 ml) is refluxed while azeotropically dehydrating. After reacting for 2 hours, the reaction mixture is cooled and washed with 6 N hydrochloric acid (28.5 ml and 12.7 ml x 2). The washing liquids are combined and are neutralized with 28 % aqueous ammonia. The mixture is stirred for 20 minutes, and the resulting precipitate is separated by filtration, washed with water and dried to give 3-amino-4-phenylpyrazole (15.16 g). This product is used in the subsequent procedure without further purification.

30 To a suspension of 3-amino-4-phenylpyrazole (3.97 g) in ethyl acetate (15 ml) - benzene (75 ml) is added with stirring a solution of ethoxycarbonyl isothiocyanate (3.28 g) in benzene (25 ml) under cooling at 5 °C. After the cooling bath is taken off, the mixture is further stirred for 15 hours. The reaction mixture is concentrated under reduced pressure, and the residue is recrystallized from ethyl acetate to give N-carbethoxy-N'-[3-(4-phenyl)pyrazolyl]thiourea (3.34 g).

The precipitate is separated by filtration, washed with methanol or ethyl acetate, and dried to give the title compound (2.08 g).

Preparations of this invention are illustrated below.

Preparation

Film coated tablets are prepared from the following components.

Components	Amount
4-Hydroxy-8-[4-(4-methylphenylthio)phenyl]pyrazolo[1,5-a]-1,3,5-triazine	100 g

TC-5 (tradename of hydroxypropyl methylcellulose manufactured by Shinetsu Kagaku Kogyo, Japan)	10 g
Polyethylene glycol 6000	3 g
Castor oil	40 g
Ethanol	40 g

4-Hydroxy-8-[4-(4-methylphenylthio)phenyl]pyrazolo[1,5-a]-1,3,5-triazine, Avicel®, corn starch and magnesium stearate are mixed and kneaded and the mixture is tabletted using a conventional pounder (R 10 mm) for sugar coating. The tablets thus obtained are coated with film coating agent consisting of TC-5, polyethylene glycol 6000, castor oil and ethanol to give film coated tablets.

The pharmacological properties of the compounds were tested as shown in the following Experiments.

Experiment 1 (In vitro)

(1) Preparation of xanthine oxidase solution:

ICR strain mice were decapitated and the small intestine of each mouse was rapidly perfused with cooled physiological saline solution and removed. The small intestine was homogenized in 4-fold volume of cooled phosphate buffered saline solution (PBS) and then centrifuged at 105,000 g for 60 minutes. The supernatant fluid was dialyzed overnight against PBS. The dialyzed solution thus prepared was stored at -20 °C until used.

(2) Preparation of the solution containing the present compound:

The compound of this invention was dissolved in DMSO (200 µl) and 2N NaOH (100 µl), and then PBS was added to prepare a solution (25 ml) containing 10⁻³ M of the compound of this invention. This solution was diluted with PBS to prepare solutions containing the compound in the concentration of 10⁻⁴, 10⁻⁵, 10⁻⁶, 10⁻⁷, 10⁻⁸, 10⁻⁹, 10⁻¹⁰, and 10⁻¹¹ M, respectively.

(3) Method for the measurement:

The assay mixture, consisted of the composition mentioned below, was incubated at 37 °C for 5 minutes. The reaction was stopped by heating in boiling water for one minute. Twenty microliters of the supernatant was analyzed by high performance liquid chromatography (HPLC) under the conditions mentioned below.

Composition of solution

5	Xanthine oxidase solution (diluted in 4-folds with PBS)	200 μ l
10	Xanthine (1 mM)	100 μ l
	Solution containing the present compound	200 μ l

Eluting solution: 10 mM phosphate buffer (pH 6.0)

20 Flow rate: 1.0 ml/minute

Detector: UV 292 nm

25 Sample volume: 20 μ l

Retention time: 2.4 minutes (uric acid)

30 (4) Percent inhibition of the compound against xanthine oxidase:

The percent inhibition was calculated by the following equation.

35 Percent inhibition (%) =

$$\frac{[\text{Amount of uric acid in control} - \text{the solution treated with the present compound}]}{\text{Amount of uric acid in control solution}} \times 100$$

40 *) Control solution means a mixture of DMSO and 2N NaOH used for the preparation of the solution containing the present compound.

45 As to each of the solutions containing the present compound as prepared in the above (2), the present inhibition was calculated, and IC₅₀ values were obtained from a plot of the percent inhibition against the log of the concentration of the compound of this invention.

50 As a positive control, a commercially available xanthine oxidase inhibitor, allopurinol (= 4-hydroxypyrazolo[3,4-d]pyrimidine) was used.

The experimental results are shown in the table hereinafter.

Experiment 2 (In vivo: oral administration)

(1) Animals, method of administration and sampling of serum:

5 Normal male ICR mice (weighting about 30 g), were provided normal diet and tap water *ad libitum*. A test compound suspended in 0.5 % CMC-Na was administered orally to the mice (each group: 6 mice) in a dose of 5 mg/kg. Four hours after the administration of the test compound, blood (about 0.6 ml) was collected from the vena cave inferior of mice under ether anesthesia, and the serum was separated from the blood in a usual manner.

10

(2) Measurement of amount of uric acid in serum:

To the serum (200 μ l) was added 10 % perchloric acid (100 μ l), and the mixture was centrifuged. To the supernatant fluid (100 μ l) was added 0.2 M Na_2HPO_4 (200 μ l), and the mixture (20 μ l) was analyzed by 15 HPLC to measure the amount of uric acid. The HPLC was carried out under the following conditions.

35

(3) Lowering effect of test compound on the level of uric acid in serum:

35

The lowering rate of uric acid in serum was calculated by the following equation.

Lowering rate of uric acid in serum (%) =

40

$$\frac{(\text{Amount of uric acid in control animal} - \text{the animal treated with the present compound})}{\text{Amount of uric acid in control animal}} \times 100$$
